Diploma

KSTU named after Razzakov

Languages

Russian — native

English — basic (technical docs)

About Me

I'm a developer who genuinely enjoys coding. I love finding simple solutions to complex problems and constantly learning new things—whether it's a new framework, architectural approach, or life skill. My positive mindset and proactivity help me not only at work but also in life.

Almurut Store

November 2023 – April 2025

Responsibilities

- Designed the interface of an e-commerce store using React + TypeScript
- Used MobX, Ant Design, and SSR with Next.js
- Developed forms, filters, product cards, and pages

Achievements

- Mastered Docker and docker-compose for environment setup
- Improved TypeScript knowledge (typing complex structures, components)
- Enhanced SEO and SSR skills with Next.js
- Became more self-reliant
- Strengthened architectural thinking and code structuring

Kurut-IT

September 2022 – July 2023

Responsibilities

- Developed SPA applications using React + Vite
- Created responsive layouts based on Figma designs
- Used SCSS, BEM methodology, and UI libraries (Bootstrap, MUI)
- Integrated REST APIs, handled state and errors
- Ensured cross-browser compatibility and responsiveness
- Participated in feature planning and UX discussions

Achievements

- Significantly improved practical React skills (hooks, components, structure)
- Enhanced communication and teamwork (planning, Git practices)
- Deepened understanding of REST API and client-server interaction
- Greatly improved speed and quality of responsive layout development

---

HTML / CSS

Confidently work with HTML and CSS, using semantic markup and modern styling approaches. Build responsive and cross-browser interfaces with attention to structure, performance, and code maintainability.

- Semantic markup
- Forms and basic validation
- Flexbox, Grid, and responsive layouts
- Class naming and style organization
- Cross-browser compatibility and performance

JavaScript

Confidently use JavaScript (ES6+) to build interactive interfaces and client-side logic. Work with the DOM, events, asynchronous operations, APIs, and data handling in the browser.

- JavaScript fundamentals and ES6+
- DOM and event handling
- Working with APIs and data
- Asynchronous programming
- Modules and code structure
- Error handling

TypeScript

Use TypeScript to build type-safe and maintainable applications. Apply strict typing to data, functions, components, and API contracts, reducing development-time errors.

- Typing for data, functions, and components
- Interfaces, Types, and Generics
- DTOs, API contracts, and external types
- Utility Types and type narrowing
- Integration with React and Node.js
- Type checking and configuration

React

Build web applications with React using a component-based approach, hooks, and state management. Create modular and scalable UIs, working with forms, client-side logic, and API integration.

- Components and Hooks
- State management
- Side effects
- Forms and validation
- API integration
- Reusable UI patterns
- Performance optimization

Next.js

Build web applications with Next.js using file-based routing, SSR, SSG, and hybrid rendering approaches. Use Next.js to create high-performance, SEO-friendly, and scalable interfaces with seamless API and TypeScript integration.

- Routing and app structure
- SSR, SSG, ISR
- Server and Client Components
- Data fetching and API integration
- SEO and performance optimization
- Integration with React and TypeScript

Node.js

Use Node.js confidently to build server-side logic, APIs, and external integrations. Strong understanding of asynchronous programming, the event loop, module system, environment configuration, and backend service architecture.

- Asynchronous programming and event loop

- Modules and environment configuration
- REST APIs
- Database integration
- File uploads
- External service integration

Express

Build server-side applications and REST APIs with Express, including manual setup of routing, middleware, validation, and error handling. Implement authentication, database integration, file uploads, and third-party service integrations.

- Routing and middleware
- Error handling
- Authentication and authorization
- Request validation
- Database integration
- File uploads and integrations

NestJS

Build backend applications with NestJS using modular architecture, dependency injection, and TypeScript. Apply guards, pipes, interceptors, DTOs, and ORM tools to create maintainable and scalable services.

- Modular architecture and DI
- Guards, Pipes, Middleware, Interceptors
- DTOs and data validation
- Authentication and authorization
- ORM and database integration
- API documentation

Git / GitHub / GitLab

Experienced in using Git, GitHub, and GitLab in both individual and team-based development. Work with branching, change history, merge/pull request workflows, conflict resolution, and basic process automation to support a transparent and well-structured development cycle.

- Branching and Git workflow
- Commits, rebase, squash, merge
- Pull requests / Merge requests
- Code review and conflict resolution
- Repository structure and documentation

- Git hooks and basic CI/CD automation

Docker

Experienced in using Docker for application containerization, isolated environment setup, and simplifying local development and deployment. Build and optimize images, configure service interaction, and use Docker Compose for multi-container applications.

- Application and environment containerization
- Docker Compose and multi-container services
- Volumes, bind mounts, and environment variables
- Port mapping and container communication
- Image optimization: multi-stage builds and caching
- Preparing dev and staging/prod environments
